Analytics Event Tracking Plan

Mizzey Operations Platform. Every event, its trigger, its parameters, where it is sent, and the ruling on which system is the source of truth for each business metric.

The Stage 1 event plan, satisfying EVT-20 and HND-12. Delivered with the Tag Manager container and the analytics accounts, all in your ownership.

COMPANION DOCUMENT

Functional Specification, MS-SPC-2026-018

1. What this document is

Annex A EVT-20 is a contractual deliverable, and it is specific about what it must contain: **every event, its trigger, its parameters, and the source of truth per business metric**. This document is that, and the last clause is the one that matters most.

A store that measures the same number in three systems will eventually report three different numbers, and the argument that follows is unwinnable without a document that says in advance which one is right. Section 9 is that ruling.

2. Who this is for

Your marketing team, and whoever they hire. Annex A EX-18 excludes running campaigns and Section V contracts the tools those campaigns need. This document is one of those tools: an agency arriving in month four should be able to read it and know what is already measured without asking for a call.

3. What is instrumented, and what is not

In the first release	The standard ecommerce event set across the full funnel, plus coupon, refund, return and zero result events
Not included	A bespoke custom event plan beyond the standard set. This is the recorded P1-L boundary at EVT-01 to EVT-19
Not included	Promotion viewed and promotion clicked, being EVT-17, which is P2
Not included	Server side tagging, being MKT-11, which is P3, and the Conversions API, being MKT-08, which is P2

4. Where events go

DESTINATION	WHAT IT RECEIVES	REQUIREMENT
Google Analytics 4	Every event in section 7	MKT-01, INT-09
Google Tag Manager	The only route any tag reaches the site by	MKT-23
Meta pixel	The standard commerce subset	MKT-02, INT-10
TikTok pixel	The standard commerce subset	MKT-03

No third party writes tracking into the site code. Every tag is deployed through Tag Manager, which is a contractual control and not a preference: MKT-21 forbids the Marketing role from editing templates or files, and MKT-23 makes Tag Manager the sanctioned route. An agency that asks for code access is asking for a Change Request.

5. Conventions

RULE	VALUE
Naming	Google Analytics 4 recommended ecommerce names, unchanged. A custom name is used only where no recommended one exists
Currency	EGP on every event carrying a value. The launch market is Egypt only, per OD-02
Values	Excluding shipping and tax unless the parameter says otherwise. purchase carries all three separately
Language	Every event carries the active locale, so English and Arabic funnels can be separated
Identity	No personal data in any parameter. No email, no phone, no name, no address. Ever
Firing	Once per occurrence. A page refresh, a back navigation or a repeated callback does not double count
Layer	Pushed to the data layer by the site, read by Tag Manager. Tags are never hard coded

NOTE

On the identity rule. Annex A NFR-12 requires data minimisation and R-04 records that electronic marketing is subject to consent obligations under Egyptian data protection law. Putting a customer email into an analytics parameter would breach both. The order id is sufficient to join back to the order inside your own systems, where the personal data already lives lawfully.

6. The item payload

Every event that carries products uses the same item shape. Defining it once is what keeps the funnel joinable end to end.

PARAMETER	SOURCE	NOTE
item_id	Product or variation SKU	The variation SKU where a variant was chosen
item_name	Product name in the active language	
item_brand	Brand taxonomy	Empty where the product has no brand
item_category	Primary category	Sub categories as item_category2 and onward
item_variant	The selected variant attributes	Empty for a simple product

PARAMETER	SOURCE	NOTE
price	Unit price actually charged or shown	The sale price where one applies
discount	Per unit discount	Zero where none
quantity	Units	
index	Position in the list	On list events only
item_list_name	The list the click came from	On list events only

PART TWO: THE EVENTS

7. Event reference

Every row is a contracted requirement from Annex A Section L.

ID	EVENT	TRIGGER	PARAMETERS BEYOND ITEMS	SCOPE
EVT-01	view_home	The home page renders	language	P1
EVT-02	view_item_list	A category, collection or search results page renders	item_list_name, item_list_id, items, language	P1
EVT-03	search	A search is executed	search_term, results_count, language	P1
EVT-04	view_item	A product page renders	items with one item, value, currency	P1
EVT-05	select_item	A product card is clicked	item_list_name, items with one item	P1
EVT-06	add_to_wishlist	An item is added to the wishlist	items, value, currency	P1
EVT-07	add_to_cart	An item is added to the cart, from anywhere	items, value, currency	P1
EVT-08	remove_from_cart	A cart line is removed	items, value, currency	P1
EVT-09	view_cart	The cart page renders	items, value, currency	P1
EVT-10	apply_coupon	A coupon is accepted. Not fired on a rejected coupon	coupon, discount_value, currency	P1-L
EVT-11	begin_checkout	Checkout is entered	items, value, currency, coupon	P1
EVT-12	add_shipping_info	A shipping method is chosen	items, value, currency, shipping_tier	P1
EVT-13	add_payment_info	A payment method is chosen	items, value, currency, payment_type	P1
EVT-14	purchase	The order reaches Confirmed. Not when Place Order is pressed	transaction_id, value, tax, shipping, currency, coupon, items	P1
EVT-15	refund	A refund completes against the gateway	transaction_id, value, currency, items on a partial refund	P1-L

ID	EVENT	TRIGGER	PARAMETERS BEYOND ITEMS	SCOPE
EVT-16	sign_up, login	An account is created, or a session begins	method, being email, google or link	P1
EVT-18	zero_result_search	A search returns nothing	search_term, language	P1-L
EVT-19	return_request	A return request is submitted	transaction_id, return_reason, items	P1-L

NOTE

Two triggers that are deliberately not the obvious ones

purchase fires when the order reaches Confirmed, not when Place Order is pressed. A pressed button is an intention; a confirmed order is a sale. Firing on the button would count failed payments as revenue, and would double count the retry. This is the same boundary AC-06 and AC-08 enforce in the order logic, applied to measurement.

refund fires on gateway completion, not on the approval decision. An approved return whose refund has not yet been issued is not money returned.

8. What fires where

Not every destination receives every event. Sending everything everywhere is how tag containers become unmaintainable.

EVENT	ANALYTICS 4	META	TIKTOK
view_item_list, select_item, view_home	Yes		
search, zero_result_search	Yes		
view_item	Yes	Yes	Yes
add_to_wishlist	Yes	Yes	
add_to_cart, remove_from_cart, view_cart	Yes	Yes	Yes
begin_checkout	Yes	Yes	Yes
add_shipping_info, add_payment_info, apply_coupon	Yes		
purchase	Yes	Yes	Yes
sign_up, login	Yes		
refund, return_request	Yes		

Which advertising platforms are live at launch is an open decision, OD-21. The instrumentation is built for all three either way; enabling a platform is a Tag Manager change, not a development task.

PART THREE: THE RULING

9. Source of truth per business metric

This is the clause EVT-20 exists for. For each metric, one system is authoritative and the others are indicative. When they disagree, the authority wins and the difference is explained rather than argued.

METRIC	SOURCE OF TRUTH	WHY, AND WHAT THE OTHERS ARE FOR
Revenue	The store admin sales report	Analytics loses events to consent refusal, ad blockers and network failure, and always undercounts. The order table cannot
Orders and units	The store admin	The same reason
Average order value	The store admin	Derived from the two above, so it inherits their authority
Refunds and returns	The store admin	The refund record carries the gateway reference. Nothing else does
Cash actually received	The payment provider settlement report, reconciled against the store	Paid is not received. PAY-19 records the distinction, and for cash on delivery SHIP-16 tracks collected separately from remitted
Cash on delivery collected versus remitted	The store, from the carrier remittance	The dashboard would otherwise overstate your cash position
Sessions, users, traffic sources, campaigns	Analytics 4	The store cannot see anonymous traffic at all
Conversion rate	Analytics 4	It needs a session denominator, which only Analytics has
Funnel drop off	Analytics 4	Indicative rather than exact, for the reasons above
Campaign attributed revenue	The store order record, using the attribution captured at MKT-09	Platform reported revenue is each platform claiming credit for the same sale
Advertising cost and return on spend	The advertising platform, with revenue taken from the store	Cost is only known to the platform. Revenue is only known to the store
Search terms and zero result terms	The store search log, at SRCH-08	Analytics site search is a subset. The store log has all of it

METRIC	SOURCE OF TRUTH	WHY, AND WHAT THE OTHERS ARE FOR
Stock	The store	There is no other candidate

NOTE

Expect Analytics to report less revenue than your admin, permanently. A gap of roughly ten to thirty percent is normal and is not a defect. Consent refusal, ad blockers, browser privacy restrictions and dropped requests all remove events, and none of them removes an order from your database. **Judge the business on the admin figures and judge the marketing on Analytics**, and never reconcile one to the other.

10. Consent

RULE	BEHAVIOUR
Before a choice is made	No advertising tag fires. No marketing identifier is set
Consent refused	Advertising tags stay off. Nothing that identifies the visitor is stored
Consent given	Tags fire normally
Recording	The choice is recorded and is changeable by the visitor

This follows MKT-10 and NFR-12, and R-04 is the reason it is not optional. **Consent handling reduces measured volume by design.** That is the trade, and section 9 already accounts for it.

11. How the plan is verified before launch

DOD-05 requires analytics events verified where required, and EVT-20 is not delivered by writing this document. It is delivered by proving it.

#	VERIFICATION
1	Every event in section 7 is fired by hand on staging and observed arriving, in English and in Arabic
2	The purchase event value reconciles to the order total on the same order, to the piaster
3	A double submitted order produces exactly one purchase event, matching AC-06
4	A failed payment produces no purchase event, matching AC-08
5	A refund produces one refund event with the correct value
6	Consent refused produces no advertising tag firing, checked in the network log rather than assumed
7	The item payload is identical in shape across view_item , add_to_cart and purchase , so the funnel joins
8	The results are recorded and handed over with the documentation, per HND-07

12. Handover

At handover this plan is delivered alongside the Tag Manager container, the Analytics property and the pixel configurations, **all in accounts owned by you** (HND-06). Nothing in the measurement stack is held in a developer account.

Mizzey Operations Platform. Analytics Event Tracking Plan. MS-EVT-2026-021, version 1.0, 6 September 2026. Stage 1 deliverable under the Statement of Work MS-SOW-2026-009, satisfying EVT-20 and HND-12. Scope is defined by the Feature Register MS-ANX-2026-001.
