Design Brief & Request for Proposal

Mizzey.com. Full brand identity and complete website user-interface design.
Every deliverable, constraint, format and requirement needed to prepare a
complete and accurate quotation.

Section 14 sets out what a proposal must contain. Read the document in full before quoting.

CLIENT

Mizzey, mizzey.com

STATUS

■ For proposal

PREPARED BY

Mustafa Shaaban

ENGAGEMENT

Full brand identity and complete website UI design.
Market: Egypt.

1. Purpose of this document

This is an invitation to submit a proposal for the complete visual design of a new premium e-commerce business. The engagement covers the creation of a full brand identity from zero, and the design of the entire website user interface.

This document is written to be self-contained. It specifies every deliverable, constraint, format and requirement needed to prepare a complete and accurate quotation without further clarification.

Please read it in full before preparing a proposal. Section 14 sets out what the proposal should contain.

2. About Mizzey

Mizzey is a new online store in Egypt. It sells a carefully selected and continuously refreshed range of products, including trending items, gadgets that simplify daily life, premium and imported goods, gifts, travel essentials, smart home products, and other high value picks.

The business currently has a name and a domain, and nothing else. There is no logo, no colour palette, no typography, no visual identity and no existing brand assets of any kind. Everything is created new in this engagement.

The website is built on WordPress with WooCommerce as the commerce platform, selected by the developer. It launches multilingual: **English as the primary and default storefront language, and Arabic fully supported at launch with complete right to left layouts.**

2.1 Positioning

Premium. Curated. Trend driven. Deliberately not a discount store.

The experience should feel selective and confident, closer to a well edited retailer that happens to sell online than to a marketplace competing on price.

This rules out aggressive red sale badges, countdown timer urgency, cluttered high density grids, and discount led visual language.

It calls for generous spacing, restrained colour, considered typography and quiet confidence.

2.2 Audience

Egyptian Class A and upper middle class shoppers who are willing to pay more for quality, convenience and trust. They value authenticity, delivery speed, easy returns and an organised buying experience. They are time poor, and want good products found for them rather than hunting for them.

2.3 Category neutrality, a defining constraint

The design must not be tied to any single product category.

Mizzey sells across many unrelated categories, and that range will keep expanding. Today it may be electronics, home goods, travel accessories and gifts. In a year it may include categories nobody has considered yet.

This means the visual identity and the interface must work equally well for a phone accessory, a kitchen tool, a suitcase, a perfume, a piece of jewellery or a smart home device.

In practice:

- The logo must not depict or allude to any specific product type
- Iconography must remain generic and category neutral
- Photography treatment and card layouts must flatter varied product shapes, whether tall, wide, small or irregular
- Colour and typography must not read as belonging to one sector
- Section headings and layout patterns must accommodate any category without redesign
- Packaging must suit any product type placed inside it

The identity is a premium container, not a themed shop.

3. Non negotiable requirements

3.1 Originality

All delivered work must be entirely original and created specifically for this project. The logo in particular must be a unique, bespoke design.

The following are not acceptable: purchased or modified stock logos, logo generator output, templates, marketplace assets, previously delivered work reused from another client, or designs derived from existing brands.

The designer is asked to warrant in writing that all delivered work is original, does not infringe any third party rights, and has not been licensed or delivered to any other party.

3.2 Figma

All brand identity and website design work is produced in Figma, and delivered as editable files with editor access shared with the client.

3.3 English is the canonical design direction, with full Arabic RTL support

Mizzey is a multilingual English and Arabic storefront. **English is the primary and default storefront language, and English is the canonical design source.** Arabic is the second fully supported storefront language, delivered in full at launch as the right to left version of the same approved experience.

The English version is the master design. In English the designer establishes the visual hierarchy, the layout, the component system, the grids, the page composition, the navigation, the typography, component sizing, responsive behaviour, states, interactions and the visual system as a whole.

The Arabic version is then designed as the RTL version of that same system. It is not a separate aesthetic concept and not a second brand. It is the Arabic right to left implementation of the Mizzey brand and experience, and it must include:

- Complete right to left mirroring wherever mirroring is appropriate
- Right aligned layout logic
- Arabic typography
- Right to left navigation patterns
- Directional icon handling, and correct arrows, carousels and breadcrumbs
- Correct form alignment, and correct product card behaviour
- Arabic text expansion and contraction handling, and Arabic content density
- Responsive right to left layouts

Both directions must work from the same component set. Layouts must mirror cleanly, and components must tolerate direction change without breaking.

Arabic is not a later phase, not partial, not optional and not a reduced version. It launches with the store.

3.4 Typography in both scripts, handled properly

English typography is defined first, since English is the canonical design. The Arabic pairing is then chosen to sit within the same premium brand rather than beside it.

English typography. A complete type scale with weights, sizes, line heights and letter spacing defined for every style, established on the English screens and forming the reference hierarchy for the system.

Arabic typography. The Arabic face must visually belong to the same premium brand, remain highly readable on mobile, support the required Arabic glyphs, work cleanly at interface sizes, and hold an appropriate weight hierarchy.

Identical typographic metrics between the two scripts are neither required nor wanted. **Aim for equivalent visual hierarchy, not identical character dimensions.**

- Arabic requires greater line height than Latin, and must be tested at realistic content lengths
- Arabic text runs roughly 20 to 30 percent longer than English for equivalent meaning, so buttons, labels and navigation sized on the English design must absorb this without truncation
- The typeface must have genuine Arabic support across multiple weights. IBM Plex Sans Arabic, Cairo, Tajawal and Almarai are acceptable starting points, and the designer should propose what best fits the positioning
- Either Arabic Indic numerals or Latin numerals should be recommended and applied consistently, with the reasoning stated
- Mixed content is normal, since Arabic descriptions will contain English brand and product names. This must be designed for deliberately

3.5 Mobile first, in both directions

Mobile is designed first, then desktop, since most traffic will be mobile.

Breakpoints: 360, 768, 1024 and 1440.

Both directions must be validated on mobile: English LTR and Arabic RTL. A layout that resolves in English on a small screen does not automatically resolve in Arabic, and right to left responsive validation is part of the expected handoff rather than something discovered during build.

3.6 A design system, not a collection of screens

The deliverable is a system of reusable, documented components with named tokens, not individually crafted pages.

3.7 Built for WooCommerce

The store runs on WordPress with WooCommerce. Standard, proven commerce interaction patterns are required. The visual identity should be distinctive, but the interaction patterns should be familiar. Novel checkout flows or non standard cart behaviour are not wanted.

The developer also uses an in-house framework layer, Corex, above WooCommerce for custom project functionality. It changes nothing about the design work and is mentioned only so the technical context is complete.

3.8 Extensibility

The system must allow the client team to build new pages, sections and campaigns in future without further design input. This requirement is expanded in section 5.2 and is central to the engagement.

PART A: BRAND IDENTITY

4. Brand identity deliverables

4.1 Logo

ITEM	SPECIFICATION
Concepts	Three distinct original directions, each presented with written rationale
Refinement	Revision rounds on the selected direction, as set out in section 12
Primary lockup	Full logo
Variants	Horizontal, stacked, icon or symbol only
Colour versions	Full colour, single colour black, single colour white, greyscale
Bilingual	Wordmark delivered in both Latin and Arabic script, visually consistent with one another
Construction	Clear space rules, minimum size rules, grid and proportion notes
Misuse	Documented incorrect usage examples

The logo must work in the following contexts: website header on light and dark backgrounds, mobile app icon, browser favicon, social media avatar in circular crop, invoices and printed documents, packaging boxes and tape, shipping labels, email signature, and physical signage.

4.2 Colour

A primary colour, secondary colours, a neutral scale of at least eight steps, and semantic colours for success, warning, error and information. All values supplied in hex, RGB and HSL, with documented usage rules and proportions. Contrast ratios verified to WCAG 2.1 Level AA against intended backgrounds.

4.3 Typography

Arabic and Latin typefaces with weights specified, and a complete type scale covering display, H1 through H6, body large, body, body small, caption, overline, button and label. Size, weight, line height and letter spacing documented for each style in both scripts. Font files supplied, or licensing details provided where fonts are commercial.

4.4 Supporting brand elements

ITEM	REQUIREMENT
Iconography	A complete, custom UI icon set covering every icon used across the interface, with style, stroke weight, corner radius and grid documented. Category neutral.
Photography direction	Written guidance on product photography treatment covering backgrounds, lighting, cropping, aspect ratios and consistency rules. Photography itself is not in scope.
Graphic language	Any supporting graphic elements, patterns or textures proposed as part of the identity
Motion principles	Written guidance on transition timing and easing for interface animation
Voice and tone	Brief written guidance for interface and communication copy, in English and Arabic

4.5 Stationery and business applications

#	ITEM
1	Business card, front and back
2	Letterhead
3	Invoice and receipt template
4	Email signature
5	Presentation template, title slide and content slide
6	Social media profile assets, including avatar and cover images for the major platforms
7	Social media post templates, at least three reusable layouts

4.6 Packaging

Packaging is a core part of the premium experience and is included in this engagement.

#	ITEM
1	Shipping box, exterior design, in at least two sizes
2	Box interior treatment, where proposed
3	Packaging tape
4	Sealing stickers or labels, in at least two sizes
5	Tissue paper or internal wrapping
6	Thank you card or insert card, front and back

#	ITEM
7	Shipping label layout
8	Paper bag or tote
9	Product hang tag or label
10	Void fill or filler material treatment, where proposed

Packaging must be category neutral, suiting any product type placed inside.

4.7 Brand guide

A document of at least twelve pages covering brand positioning, logo usage and misuse, colour system and rules, typography system and rules, iconography, photography direction, graphic elements, voice and tone, packaging application, and stationery application.

PART B: WEBSITE UI DESIGN

5. Design system

5.1 Design tokens

Delivered as Figma variables or styles, and exported in a structured, developer readable format such as JSON or CSS custom properties.

TOKEN GROUP	SCOPE
Colour	All brand, neutral and semantic values, with light and dark surface variants
Spacing	A defined scale of at least eight steps
Typography	Every style in the scale, in both scripts
Border radius	All values used
Border width	All values used
Shadow and elevation	All levels used
Breakpoints	All four
Z index	Layering scale for overlays, modals, dropdowns and toasts
Motion	Duration and easing values
Grid	Column counts, gutters and margins at each breakpoint

5.2 Design system documentation

The system must enable the client development team to build new pages independently after the engagement ends. This is a stated business requirement.

ITEM	REQUIREMENT
Component usage guidance	When to use each component, and when not to
Layout grid	Documented at all four breakpoints
Spacing rules	How components combine, vertical rhythm, and section padding

ITEM	REQUIREMENT
Page composition patterns	Reusable section templates from which new pages can be assembled, including hero, product grid, banner, feature row, split content, testimonial, call to action block, category showcase and editorial block
Responsive rules	How each component adapts across breakpoints
LTR and RTL rules	The component library is one unified Mizzey design system that works in both directions. Document, for every applicable component, what mirrors and what does not: spacing behaviour, icon mirroring rules, directional controls, breadcrumb direction, pagination, sliders and carousels, form alignment, validation and error messages, tabs, accordions, menus, drawers, modals, cards, badges, pricing and quantity controls. The developer should not have to guess how a component changes from LTR to RTL
Content rules	Character limits, truncation behaviour and overflow handling
Naming conventions	A consistent, documented naming approach for components and tokens

6. Component library

Every component delivered in all applicable states: default, hover, active, focus, disabled, loading, error and selected.

One unified system, two directions. There is a single Mizzey design system, not an English one and an Arabic one. Components are designed in English as the canonical direction, and each must be specified so it can be built and rendered correctly in Arabic right to left. Where a component's behaviour changes with direction, that change is documented in the LTR and RTL rules in section 5.2.

6.1 Core interface

Buttons in primary, secondary, tertiary, ghost, destructive, icon only and with icon variants, across three sizes. Links, inline, standalone and with icon. Text input, textarea, select, multi select, checkbox, radio, toggle, quantity stepper, search field with clear action, date picker, file upload, range slider. Form field wrapper with label, helper text, error message and required marker. Fieldset grouping.

Third party sign in button, designed to Google's published branding requirements, in English and Arabic, in all interactive states. It must sit naturally beside the standard email and password form rather than appearing added on afterwards.

6.2 Navigation

Header for desktop and mobile, mega menu expanded, mobile navigation drawer, category navigation, breadcrumb, pagination, load more control, tabs, vertical side navigation for account pages, footer, announcement bar, back to top control.

Language switcher, in header and footer placements, in both directions. This is a primary control, not a minor one. The store launches with English as the default and Arabic fully available, and customers will use it.

6.3 Product components

Product card in grid, list and compact carousel layouts. Product image gallery with thumbnails, image zoom overlay, variant selector covering colour swatches, size chips and dropdown variants. Price display for regular, sale, price range and per unit. Rating display with and without count. Stock status indicator, wishlist control in active and inactive states, quick add control, product carousel.

6.4 Badges and labels

All of the following, with defined colour and placement rules:

New, Trending, Best Seller, Exclusive, Limited Edition, Sale or discount percentage, Free Shipping, Out of Stock, Low Stock, Pre order, Imported, Verified Purchase.

Order status badges covering the full lifecycle: Pending Payment, Payment Failed, Confirmed, Preparing, Shipped, Out for Delivery, Delivered, Cancelled, Return Requested, Return Approved, Return Rejected, Returned, Refund Pending, Refunded, Partially Refunded.

Badges must remain legible in both scripts, and must not rely on colour alone to convey meaning.

6.5 Feedback and messaging

Toast notification in success, error, warning and information variants, with and without action. Inline alert banner in all four types. Page level banner. Modal dialog in small, medium and large. Confirmation dialog. Bottom sheet for mobile. Tooltip, popover, progress bar, free shipping progress indicator, checkout step indicator, loading spinner. Skeleton loading states for product card, product grid, product detail, list row and text block. Reusable empty state layout with icon, message and action.

6.6 Data display

Responsive table, list row, definition list for specifications, accordion, removable and static tags, divider, card container, statistic display, order tracking timeline, avatar and initials.

6.7 Commerce specific

Cart line item, order summary block, coupon input with applied, error and removed states. Address card with selected and default states. Payment method selector, shipping method selector. Filter panel for desktop and as a mobile overlay, applied filter chips, sort control. Review card, review submission form, star rating input. Newsletter signup block, trust badge row, social share row.

7. Screens

Every screen designed at desktop and mobile. Tablet may be handled by documented responsive rules rather than separate frames, unless the proposal specifies otherwise.

Two language versions of every core storefront template. For each of the core customer facing templates below the designer provides:

1. **The approved English canonical design**, which is where the layout, hierarchy, components and sizing are established
2. **The Arabic RTL adaptation** of that approved design, as the right to left localisation of the same experience

At minimum this applies to the header and navigation, home, category and product listing, search results, product detail, cart, checkout, authentication, account, orders, wishlist, returns, static and policy pages, campaign and promotional pages, and the relevant mobile variants of each.

Automatically mirrored English screenshots are not an acceptable substitute for proper Arabic right to left design. Where a screen is a state or variant of another rather than a distinct layout, the Arabic version may follow the same rule as the English one, provided the direction specific behaviour is documented.

The administration panel remains outside this engagement, in English only, and no admin interface design is requested. See section 9.

7.1 Storefront

#	SCREEN	NOTES
1	Home	Hero, trending, new arrivals, best sellers, curated collections, category showcase, active offers, recommended, trust block, social proof, newsletter
2	Category and product listing	Grid, filter panel, sort, breadcrumbs, category SEO copy, pagination
3	Collection page	Curated collection presentation
4	Brand page	Brand logo, description, product grid
5	Search results	Including auto suggest dropdown
6	Search, no results	Alternative suggestions
7	Product detail	Gallery, zoom, variants, price, trust block, description tabs, specifications, related products, reviews
8	Product detail, out of stock	Notify me variation

#	SCREEN	NOTES
9	Offer and campaign landing page	Reusable template

7.2 Purchase

#	SCREEN	NOTES
10	Cart	Line items, coupon, free shipping progress, totals, cross sell
11	Cart, empty	
12	Checkout	Contact, address, shipping method, payment method, review, place order
13	Checkout, validation errors	
14	Order confirmation	Order number, summary, estimated delivery, tracking action, guest account creation
15	Payment failed	Retry path
15a	Guest order lookup and tracking	Order number and contact detail, then the tracking view. Guests buy without an account and still need to follow their order

7.3 Account

#	SCREEN	NOTES
16	Login	
17	Register	Including welcome discount presentation
18	Forgot and reset password	
19	Account dashboard	Sets the pattern for all account pages
20	Addresses	List, add, edit, default handling
21	Order list	
22	Order detail with tracking timeline	
23	Return request form	
24	Wishlist, with empty state	
25	Notification preferences	

#	SCREEN	NOTES
26	Returns list	Every return the customer has raised, with status against each. Sets the pattern for return status presentation. Empty state required
27	Return detail with status timeline	Items returned, reason, submitted photographs, decision, and a status timeline consistent with the order tracking timeline on screen 22
28	Refund confirmation	Amount, method, reference and expected timing. May be delivered as a state of screen 27 rather than a separate frame, provided it is fully specified

7.4 Content and system

#	SCREEN	NOTES
29	About Us	
30	Contact	Form and channels
31	FAQ and Help Centre	
32	Static and policy page template	Covers shipping, returns, privacy, terms and authenticity
33	404 error	
34	500 and maintenance	

7.5 Overlays

Cookie consent banner, newsletter signup modal, mobile filter overlay, mobile search overlay, cart drawer if proposed, and any regional or age notice if applicable.

7.6 Loyalty and referral, priced as an option

These three screens are not part of the required scope. None of the loyalty points programme, the VIP tiers or the referral programme is contracted. The referral programme sits in the growth phase and loyalty points and VIP tiers sit in the advanced phase, so none of their screens is needed to launch the store.

They are listed because there is a real argument for designing them now: the visual language would be set once, by the same designer, rather than improvised later by someone else. **Please price them separately as an option**, so the decision can be taken on cost rather than assumed either way.

#	SCREEN	NOTES
O1	Points balance and history	Current balance, progress toward the next tier, and a readable history of points earned, spent and expired
O2	Points redemption at checkout	How points are applied to an order, shown within the existing checkout flow rather than as a separate step

#	SCREEN	NOTES
03	Referral page	The customer's referral link, how to share it, what both sides receive, and the status of people they have invited

If they are designed, points and tiers should feel like a reward, not an accounting statement. The balance is the emotional element and should be treated as such.

7.6a Returns as a trust moment

The returns experience is a trust moment, not an administrative one. In a premium store the customer requesting a return is deciding whether to buy again. Screens 26 to 28 should reassure rather than obstruct, and must not feel like a different product from the rest of the site.

The same applies to sign in and registration. These should read as the shortest credible path to an account, not as a form to be completed.

7.7 Required states

Every screen must be delivered with its empty, loading, error and success states where applicable. Undesigned states become improvised during build and appear broken to users, so these are explicitly within scope.

8. Email template design

Transactional email is a core part of the customer experience and is included in this engagement.

#	EMAIL
1	Welcome and account created, including verification and welcome discount details
2	Email verification
3	Password reset
4	Order confirmation with itemised summary
5	Payment failed with retry link
6	Order shipped with carrier and tracking
7	Out for delivery
8	Order delivered with review invitation
9	Order cancelled
10	Return request received
11	Return approved or rejected

#	EMAIL
12	Refund completed
13	Back in stock
14	Abandoned cart
15	Reusable newsletter template

Email specifications: a master template with reusable header, footer and modular content blocks. English LTR as the canonical version, with the Arabic RTL version of each template. Maximum width 600 pixels, mobile responsive. Designed for reliable rendering in common email clients, using table safe layouts, specified web safe fallback fonts, and no reliance on background images for legibility. Light background with a dark mode safe logo treatment specified. Reusable modules for order item, totals, address, button and divider. Plain text fallback content guidance.

9. Out of scope

The following are not part of this engagement: website administration panel design, product photography and image retouching, copywriting and content creation, front end or back end development, advertising creative and paid campaign assets, and physical production or printing of packaging.

Blog, article, news and editorial templates are not part of this engagement and are not anticipated in any future phase.

10. Materials provided

On engagement the client supplies: sitemap and information architecture, user flows for the core customer journeys, real product content in English and Arabic including actual product names, descriptions, specifications and prices, and reference examples of sites the business admires and does not admire with reasons. A technical contact is available throughout for feasibility questions.

English is the primary design copy language, since the English screens are the canonical design. Designs should be presented using the real content supplied rather than placeholder text.

Arabic screens must use real or representative Arabic content. Arabic behaves differently from Latin at realistic lengths, and layouts that resolve in placeholder text routinely break on actual content. Where final Arabic marketing copy is not available at design time, representative Arabic content may be used to validate layout. Final content remains a client and project responsibility.

11. Deliverable formats

DELIVERABLE	FORMAT
Design files	Figma, with editor access shared with the client. English canonical screens and Arabic RTL screens or variants, organised so the pairing is obvious
Logo	Vector source file, optimised SVG, and PNG with transparency at the sizes needed for the contexts in section 4.1
Favicon and app icon	ICO and PNG at standard sizes
Icon set	Individual SVG files
Packaging and stationery artwork	Print ready PDF with dielines, bleed and colour specified for print
Brand guide	PDF
Design system documentation	PDF, or as a page within the Figma file
Design tokens	Structured export such as JSON or CSS custom properties
Fonts	Font files, or licence details where the typeface is commercial

Since Figma is a screen design tool, packaging and stationery artwork intended for print is best prepared in a print application and supplied as print ready PDF. Figma presentation mockups are welcome alongside.

11.1 What the development team receives at handoff

The handoff should let the development team build without guessing. It comprises:

- **English canonical screens**, as the approved master design
- **Arabic RTL screens or variants** for the core templates in section 7
- Responsive behaviour across all four breakpoints, validated in both directions
- Component states, as listed in section 6
- Design tokens, in the structured export format above
- Typography specifications for both scripts
- Spacing rules and grid rules
- The component library itself
- Reusable assets and the icon set
- **Icon direction rules**: which icons mirror in right to left and which do not
- Localisation notes relevant to layout and direction

12. Project stages, revisions and feedback

12.1 Project stages

The engagement is divided into six stages. Each is presented for review and approved in writing before the next begins.

STAGE	CONTENT
1	Logo concepts, selection and refinement
2	Brand identity system: colour, typography, iconography, supporting elements
3	Brand applications: stationery, business applications, packaging
4	Design system: tokens, documentation, component library
5	Website screens, all groups and states: English canonical designs approved first, then the Arabic RTL versions of the core templates
6	Email templates, in English and Arabic

12.2 Revisions

A minimum of two consolidated revision rounds per stage should be included in the quoted price. Proposals may offer more, and should say so clearly.

12.3 What the proposal should specify

Design projects more often run into difficulty over revisions than over the original work, so this section is treated as a material part of the proposal.

Please address each of the following.

Number of rounds. How many revision rounds are included at each of the six stages. The logo stage and the website screens stage typically attract the most feedback, so please state these explicitly rather than giving a single blanket figure.

Definition of a round. What counts as one revision round. For example, whether a round is one consolidated set of written comments, and how a follow up question or a small correction after a round is treated.

Revision versus new work. Where the line is drawn between adjusting existing work and creating new work. For example, changing a colour or adjusting spacing, compared with restructuring a screen layout or replacing a component.

Turnaround. The expected turnaround time for each revision round, at each stage.

Feedback format. How feedback should be submitted, whether as Figma comments, a written document, or another method, and any requirements around consolidating comments before a round begins.

Beyond the included rounds. What happens once the included rounds are used, the rate for additional rounds, and how this would be raised before the work is done rather than after.

Full concept rejection. What happens if none of the three logo concepts is accepted. Whether a further set of concepts is included, and if not, what it would cost. It is better for both sides that this is agreed in advance rather than negotiated at the time.

Direction change after approval. What happens if the client requests a change to something already approved in writing at an earlier stage.

Approval mechanism. How stage approval is recorded and confirmed.

12.4 Client commitments

In return, the client commits to consolidating all feedback into a single set per round, routing all feedback through one named person with approval authority, and confirming stage approval in writing before the next stage begins.

13. Terms

Originality warranty. The designer warrants that all delivered work is original, created specifically for this project, does not infringe any third party rights, and has not been licensed or delivered to any other party.

Intellectual property. Full rights in all delivered work transfer to the client on final payment, including the right to sub license to third parties engaged by the client.

Confidentiality. A non disclosure agreement is signed before any project materials are shared.

Source files. Delivered in full before final payment is released.

Currency. All pricing in EGP.

Portfolio rights. The work may be displayed in the designer's portfolio following the public launch of the website.

14. Proposal requirements

14.1 Pricing

Pricing may be presented in the designer's own format, provided it is detailed and separates the two parts clearly.

Part A, brand identity, with a breakdown covering the logo, colour and typography systems, iconography, supporting brand elements, stationery and business applications, packaging, and the brand guide.

Part B, website UI design, with a breakdown covering design tokens, design system documentation, the component library, each screen group, overlays, and email templates.

A combined total should also be stated. The client may award either part independently, so the two need to be separable.

Please also state rates for an additional revision round, an additional set of logo concepts, an additional screen at desktop and mobile, an additional email template, an additional packaging item, and an hourly rate for any out of scope work.

14.2 Revisions and feedback

A response to section 12.3, covering each point listed there.

14.3 Payment terms

The preferred payment schedule and terms, including the split across milestones, the payment method preferred, and the payment window expected after each invoice.

14.4 Timeline

A full schedule, including total duration from engagement to final delivery, a stage by stage breakdown with durations, and the point at which the design system and the first screens would be available.

Website development runs in parallel with design, and components approved early are built before the full set is complete, so please indicate how the work would be phased rather than delivered as a single final handover.

Please also state any dependencies on client input, and how much time is assumed for each review cycle.

14.5 Approach

A written summary of how the work would be approached, addressing specifically how the English canonical design and its Arabic RTL localisation are handled as one system, how category neutrality is achieved and maintained, and how the design system is structured for future extensibility by the client team.

14.6 Portfolio

Three to five relevant projects. Please include Arabic or RTL work where available, and note where it is not.

14.7 Process and availability

The working approach and handoff method used, current workload, and the capacity that would be allocated to this project.

14.8 Confirmations

Please confirm in writing acceptance of the originality warranty, the intellectual property terms, the non disclosure agreement, **English as the canonical design direction with full Arabic RTL localisation of the core templates**, the category neutrality requirement in section 2.3, delivery of all required states for every screen and component, inclusion of packaging and email templates, and design system documentation sufficient for the client team to build new pages independently.

15. Reference notes

Additional detail to support accurate quotation.

Existing assets. None. No logo, colours, typography, imagery or guidelines exist. The name and the domain are the only fixed elements.

Name origin. Mizzey is a coined name with no prescribed meaning. The designer is free to interpret it.

Language of delivery. English is the canonical design language and every screen is presented in English first. The Arabic RTL version is then delivered for the core storefront templates listed in section 7, as the right to left localisation of the approved English design. Where the Arabic version of a minor state or variant follows directly from documented direction rules rather than a distinct layout, that is acceptable, provided the rules are written down.

Dark mode. Not required for launch. Tokens or structures that would ease its later addition are welcome but not mandatory.

Accessibility. WCAG 2.1 Level AA for colour contrast, focus indication and touch target sizing.

Animation. Motion principles and token values are required. Detailed animation specification or interactive prototyping is not required, and should be priced separately if included.

Icon set. A custom set is expected rather than an unmodified open source library, to maintain category neutrality and brand consistency.

Product imagery for mockups. Placeholder product imagery may be used for presentation purposes. Real photography is supplied by the client at a later stage.

Number of product categories. Approximately six to ten top level categories at launch, expanding over time. The design should not assume a fixed number.

Screen count. Thirty five screens are required, listed in section 7 and numbered 1 to 34 with an additional screen 15a, each at desktop and mobile, plus the overlays in section 7.5. Each is designed in English as the canonical version, and the core storefront templates additionally require an Arabic RTL version, as set out in section 7. Three further screens, O1 to O3 in section 7.6, are optional and priced separately. **Please state clearly in the proposal how the Arabic RTL versions are counted and priced**, since this is the single most common source of disagreement on a bilingual engagement.

Figma seats. The client provides the Figma project and the seats required.

Packaging production. The client arranges printing and production. The designer supplies print ready artwork only, and is not responsible for print quality or supplier coordination.

Content responsibility. All product content, marketing copy and legal text is written by the client.

Concurrent development. Website development runs in parallel with design, so a phased delivery schedule is preferred over a single final handover.
